2 INTRODUCTION

2.1 Model Explanation and Peripherals

- Thank you for choosing DELTA DVP Series PLC. The DVP06XA-H allows the connection of four analog inputs and 2 groups 12 bits digital outputs (voltage/current). The DVP-PLC EH Series MPU converts the input into a 12 bit digital signal and the output into a 2 points analog signal, which then be manipulated by using TO and FROM instructions in the ladder logic program. There are 49 Controlled Registers (CR, each register has 16-bit) in each module.
- Software version of DVP06XA-H analog input/output module can be updated via RS-485.
- Users can select input from voltage or current via wiring. Voltage input range is ±10V DC (resolution is 5 mV) and current is ±20mA (resolution is 20 μA).
- Users can select output from voltage or current via wiring. Voltage output range is 0V ~ +10V DC (resolution is 2.5 mV) and current is 0mA ~ 20mA (resolution is 5 μA).

LSB (Least Significant Bit): 1. Voltage input: 1_{LSB}=10V/2000=5mV. 2. Current input: 1_{LSB}=20mA/1000=20μA.

Explanation:

1. CR#0: The PLC model type.

2. CR#1: b11~b0 are used to set 4 internal channels working mode of analog input module (AD). b12~b15 are used to set 2 channels working mode of analog output module (DA). Every channel has four modes that can be set individually. For example: if setting CH1 to mode 0 (b2~b0=000), CH2 to mode 1(b5~b3=001), CH3: mode2 (b8~b6=010), CH4: mode 3(b11~b9=011), means set b0~b11 to H688. If setting CH5: mode 2 (b13~b12=10), CH6: mode 1 (b15~b14=01), means set b12~b15 to H5. The factory setting is H0000.
3. CR#2 ~ CR#5: Used to set the number of input readings be used for the calculation of average temperature. The available range is K1~K4096 and factory setting is K10.
4. CR#6 to CR#9: The average temperature (℃). The average temperature is calculated by using multiple temperature readings. Example: If CR#2 is 10, the temperature in CR#6 will be the average of last 10 readings on CH1.
5. CR#10 ~ CR#11 are used to set the output value of CH5 and CH6. The setting range is K0~K4000. The factory setting is K0 and unit is LSB.
6. CR#12 ~ CR#15: are used to save the present value of input signal of CH1~CH4.
7. CR#16, CR#17, CR#28, CR#29 are reserved.
8. CR #18~ CR #21: content is the value to adjust the OFFSET of CH1~CH4 if analog input either in voltage or in current is 0 after convert from analog to digital. Voltage setting range: -5V~+5V(-1000LSB~+1000LSB). Current setting range: -20mA~+20mA (-1000LSB~+1000LSB).
9. CR #22~ CR #23: content is the value to adjust the OFFSET of CH5~CH6 if analog input either in voltage or in current is 0 after convert from analog to digital. The factory setting is K0 and the unit is LSB. The setting range is -2000~+2000. Voltage setting range: -5V~+5V(-2000LSB~+2000LSB). Current setting range: -10mA~+10mA (-2000LSB~+2000LSB).
10. CR #24~ CR #27: The value to adjust GAIN of CH1~CH4. This analog input value either in voltage or in current after convert from analog signal to digital is 4000. Voltage setting range: -4V~+20V(-800LSB~+4000LSB). Current setting range: -16mA~+52mA (-800LSB ~+2600LSB). Please be noticed that GAIN VALUE – OFFSET VALUE = +200LSB~+3000LSB (voltage) or +200LSB~+1600LSB (current). If the value difference comes up small (within range), the output signal resolution is then slim and the variation is definitely larger. On the contrast, if the value difference exceeds the range, the output signal resolution becomes larger and the variation is definitely smaller.
11. CR #28~ CR #29: The value to adjust GAIN value of CH5~CH6. This analog input value either in voltage or in current after convert from analog signal to digital is 2000. Voltage setting range: -4V~+20V(-1600LSB~+8000LSB). Current setting range: -8mA ~+40mA (-1600LSB~+8000LSB). Please be noticed that GAIN VALUE – OFFSET VALUE = +400LSB ~+6000LSB either voltage or current. If the value difference comes up small (within range), the output signal resolution is then slim and the variation is definitely larger. On the contrast, if the value difference exceeds the range, the output signal resolution becomes larger and the variation is definitely smaller.
12. CR#30 is the fault code. Please refer to the chart below.

13. CR#31: RS-485 communication address. Setting range is 01~255 and factory setting is K1.
14. Example:

Explanation:

- Read the model type of extension module K0 (should be H0604 for DVP06XA-H model type).
- If the model type is DVP06XA-H, set the input mode (CH1, CH3, CH4)= mode 0, (CH2)= mode 2, and set the output mode is (CH5)=mode 0, (CH6)=mode 2.
- Set the average times of CH1 and CH2 to K32.
- Read the input signal average value of CH1~CH4 (4 data) from CR#6~CR#9 and save to D20~D23.
- Every second, D100 will increase K1 and D101 will increase K5. D100 and D101 will be cleared to 0 when its value reaches K4000.
- Write the output setting value of D100 and D101 to CR#10 and CR#11. The analog output value of CH5~CH6 will vary with D100 and D101.
